Electric Momentum

Six-week project development journal for my TunePad music project

First version

WEEK 1

Initial Experiment

In the first week, I started experimenting with TunePad and created a simple piece of music using a keyboard and drums.

My main goal was to understand how TunePad worked and how Python code could be used to create musical notes and rhythms.

This was my first step in developing the project, and the composition was still very basic.

WEEK 2

Adding a Second Keyboard

In the second week, I added another keyboard track to improve the musical arrangement.

I wanted the two keyboards to work together and make the music sound more complete.

This stage helped me explore how different musical parts could be combined within one project.

Turning point

WEEK 3

Starting Again

In the third week, I decided to abandon my previous musical arrangement and restart the project.
Instead of continuing to add more instruments to the original composition, I wanted to develop a clearer musical direction.
This was an important turning point because I changed my approach to the project rather than simply modifying the existing music.

New composition

WEEK 4

Developing the Main Melody

In the fourth week, I successfully developed the main melody for my new composition.

This gave the project a clearer musical identity and provided a foundation for adding other instruments.

After completing the main melody, I could focus on designing the accompaniment around it.

WEEK 5

Building the Instrumental Arrangement

In the fifth week, I developed the initial versions of the drums, keyboards, acoustic guitar and electric bass.
My main focus was to combine these instruments with the main melody and build a fuller composition.
At this stage, the project was becoming more complex because different tracks needed to work together.

WEEK 6

Expanding and Refining the Composition

In the sixth week, I added two more keyboard tracks and a synth strings track.
I also revised the existing drums, acoustic guitar and electric bass tracks to improve the overall arrangement.
Instead of only adding new sounds, I focused on adjusting how the instruments worked together.
By the end of this stage, the project had developed into a seven-track music prototype.
